

From Pharaohs to Foreign Aid

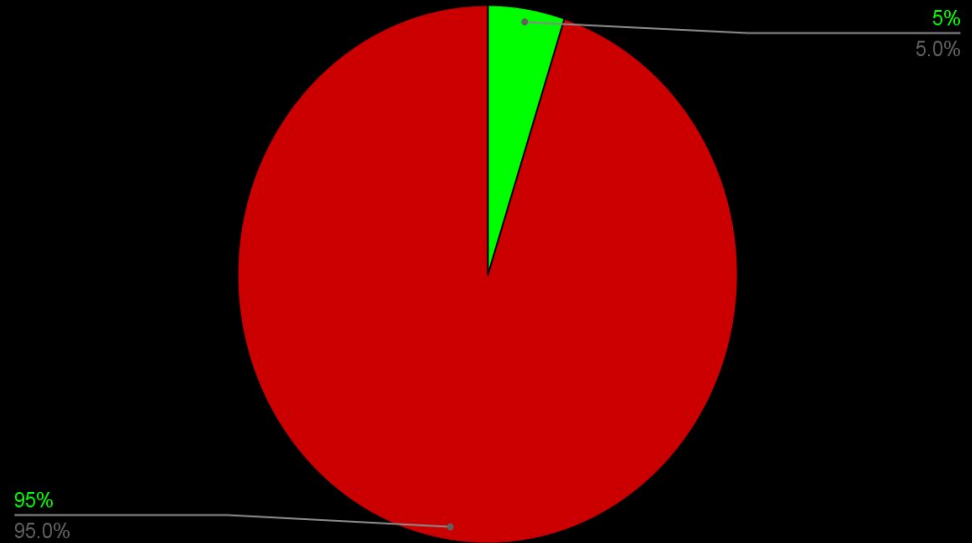

Unmanageable Population Growth

Egypt's land: inhabitable vs uninhabitable

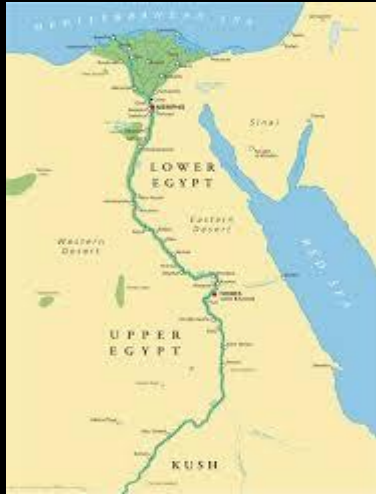

Only 4-5% of Egypt is
Inhabitable while the
Other 95-96% is uninhabitable
Dessert.

Land

Compared to the USA

Compared to the Usa 4-5% of Egypt that's about 40,000-50,000 Kilometers. That's almost the size of New York city metro area.

117,243,819

117,243,819

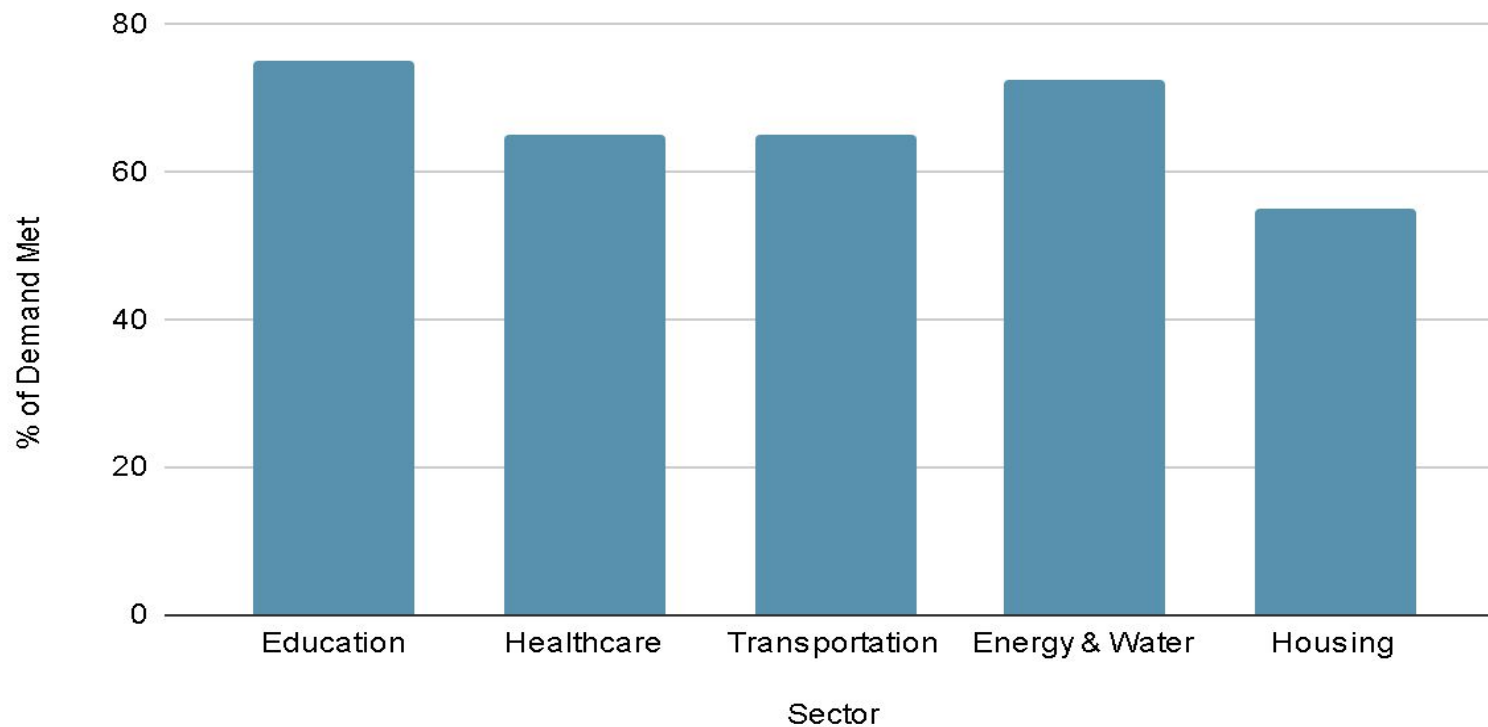

117,243,819 is the staggering population of Egypt as of 2023

To put this in perspective if every Egyptian stood at equal distance from each other each person across the whole inhabitable area would be standing 7-9 feet away from the next one barely reaching the 6 ft social distancing requirement during Covid-19. And that does not even take in consideration the area consumed by infrastructure.

Egyptian government struggling to satisfy infrastructural demand.

% of Demand Met vs. Sector

The inability to satisfy demand has caused significant issues

For example, the vacuum of house shortages has caused a trend of unauthorized building of residential buildings in the past 70 years. Fastforwarding to 2023 over 42% of Egypt is illegally built.

Cairo the city that once won most beautiful City in the world against cities like London And Paris in 1910 becomes nothing but a sheer Memory of what it once was.

Population by 2030

Using data from 1950 to 2017

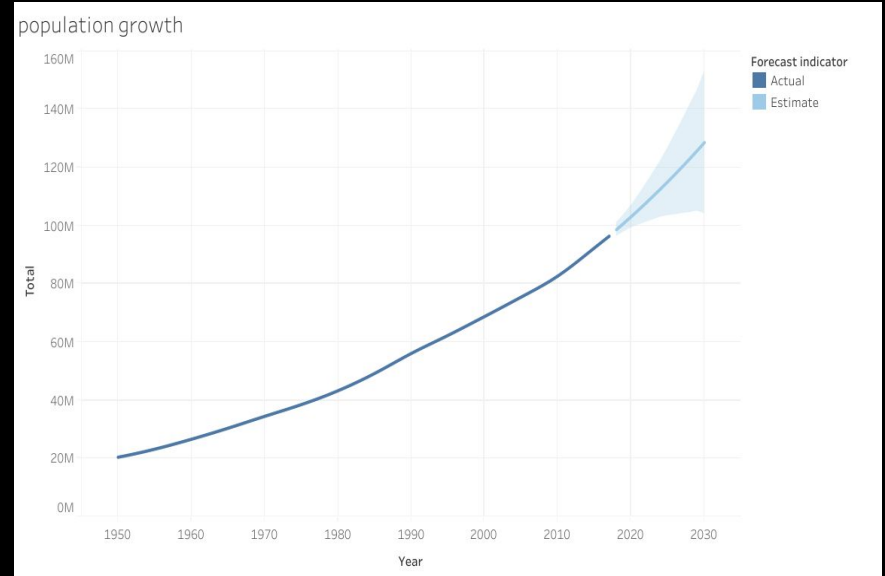

Shows that if Egypt keeps going

On this track the population would be

Almost half of the USA by 2030. Thats

Half of the USA in the New york metro

Area. increasing by 2%+ yearly.

Today, 5-10% of Egypt's needs come from foreign aid. The Egyptian government has blamed that on the population size one too many times.

So with the consistent increase in population and no sustainable solutions in effect. Can't help but wonder

Will the pharaohs that were known in history for being the start of civilization be the greatest example of its failure? Or will they beat all odds.
